NUCLEIC ACIDS RES. 18.4018-4018(1990).
-!- FOUNCION: THE PROTEBACME IS A MULTICATALYTIC PROTEINASE COMPLEX WHICH IS CHARACTERIZED BY ITS ABILITY TO CLEAVE PEPTIDES WITH ARG, PHE, TYR, LEU, AND GLU ADJACENT TO THE LEAVING GROUP AT NEUTRAL OR SLIGHTLY BASIC PH. THE PROTEASOME HAS AN ATP-DEPENDENT PROTEOLYTIC ACTIVITY.
-!- PATHWAY: IS INVOLVED IN AN ATP/UBIQUITIN-DEPENDENT NON-LYSOSOMAL PROTEOLYTIC PATHWAY:
-:- SUBUNIT: THE PROTESSOME IS COMPOSED OF AT LEAST IS NON IDENTICAL SUBUNITS WHICH FORM A HIGHLY ORDERED RING-SHAPED STRUCTURE.
-!- SUBGELLULAR LOCATION: PROTEASOMES ARE FOUND IN THE CYTOPLASM AND ALSO IN THE NUCLEUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-NOV-1990 (REL. 16, CREATED)

Claim 81, Fig 53, 184pp. English.

CDNA2 is a melanoma antigen (MART-1) which is recognized by
T-lymphocytes, and is a derivative of the melanocyte-melanoma-
pecific antigen gp100 (see R84855). Antigen cDNA25 is a source
of immunogenic peptides (see R84859) which are optionally modified
(see R84200-R84211) to enhance their binding to a MRC molecule and
used in medicaments, especially vaccines, for the treatment or
prevention (by immunisation) of melanoma. Antibodies against cDNA2
and its immunogenic peptides may be used in the detection and
isolation of the antigen from a sample, the detection of which is
indicative of a disease state (melanoma or metastatic melanoma).
                                                                                        DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.
                                                                                                                                                                                                                                                                                                                              Score 54; DB 15; Length 661;

Claim 81; Fig 7A; 184pp; English.

Claim 81; Fig 7A; 184pp; English.

G pol00 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen collaboration of the continuogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against cDNA2 and its immunisation from a sample, the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New soluble human CD4 glyco:protein - has decreased affinity for New soluble human CD4 glyco:protein - has decreased affinity for New soluble human CD4 glyco:protein - has decreased affinity for HIV infections

HIV infections

Disclosure; Table 1; 41pp; English.

Mutant Mi3 is one of 17 modified CD4 proteins analysed for class II MHC binding. It corresponds to domains I and II of the human CD4 protein in which Glu at position 150 is replaced with Arg. Mutant Mi3 is not one of the preferred mutants of the invention as it retains its Class II MHC binding affinity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Brotein prodn. from lactic acid bacteria - transformed with food are protein prodn. from lactic acid bacteria - transformed with food prace plasmid having theta replication mechanism and stably maintained under non-selective conditions

PT maintained under non-selective conditions

PT maintained under non-selective conditions

CC The inventors claim a food grade plasmid in which the replicon and any DNA sequences required for stable maintenance in the bacterium are derived from pwW02 originating from Lactococcus lactis subsp.

CC The inventors claim a food grade plasmid of 3.8kb. It replication via a theta-mechanism. Possible promoter and RBS sites upstream of the ORF are indicated. The ORF has extensive similarity to the ORF encoding crare indicated. The ORF has extensive similarity to the ORF encoding the replication gene is preceded by a 2.5 bp 3 1/2 direct plasmids. Analagous to pC1305 the ORF was denoted ORF repB. Like CC repeat upstream of which an AT-rich sequence is present. Outside this region, a 1.8kb stretch was found that showed three different repeatlups and just overlapping the first repeated sequence of 50 bp cc Preceding and just overlapping the first repeated sequence of 50 bp crepeat and in the 100 bp repeat, but is absent from the 200 bp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                             New gamma-amino butyric acid permease gene - for growth inhibition of microbial or plant cells or as selectable marker Disclosure; Fig 1; 15pp; German. The gene gabP is obtd. from the genome of E.coli K12 by cleavage with BamHI and HindIII. It encodes GABA permease. Overexpression of the gene in microbial or plant cells may be used to produce cytokoxic effects in microorganisms, plants, plant cells or seeds. Sequence 466 AA;

adversely affected. The neutral sites are identified by analysing the viral genome to identify OREs which are likely to encode functional genes and selecting sites between such OREs or within sequences for non-functional genes. The sequence shown is that transcribed from the vaccinia virus WR strain positions 23501-25000 contg. the regions covered by the four fragments Salf, G, H and I. The sequence was transcribed in all three reading frames to determine genuine vaccinia virus genes via codon usage, thus determining neutral sites. HPV DNA sequences may be inserted neutral sites, e.g. those encoding E6 or E7 of HPV 16 and 18 or mutants of these proteins. The recombinant virus vector may be used immunotherapeutically to activate cells of the immune system against HPV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 66-69; 103pp; English.

In situ production of a homologous autolysin or a heterologous autolysin from a food grade Gram positive bacteria, can be used in a process for the lysis of a culture of lactic acid bacteria. The process can be used in the manufacture of products containing cultures of lactic acid bacteria e.g. cheese, where the culture is lysed following the completion of fermentation. The enhanced induction of the autolysin is performed some hours after the fermentation is finished. No extra lysin meeds to be added and the lysin does not need to be isolated or encapsulated. The time of lysin can be precisely controlled. This is the Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

M We tocopherol cyclase in homogeneous form - which acts on phytyl benzo:quinol derivs. to produce R',R',R'-tocopherol cpds.

Mew tocopherol cyclase enzyme may be isolated from green algae, comparison of the novel tocopherol cyclase enzyme may be isolated from green algae, comparison of the novel tocopherol cyclase enzyme may be isolated from green algae, comparison the soluble cellular fraction. To has a mol. wt.

M PS outlivating these cells, disrupting them and isolating and printifying TC from the soluble cellular fraction. To has a mol. wt.

Of 48-50 kb, an opt. PH range of 6.5-7, opt. temp. of 25-35 deg. C, a stabilisation in glycerol of 8-12 percent and contains the peptide fragment shown (some residues uncertain). The TC can be used to convert phytyl benzoquinol derivs. to produce R',R',R'-tocopherols see also R33193-203.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant plasmids to integrate in Aspergillus chromosomal DNA - useful for expressing higher eucaryotic genes esp, when plasmid contains transcriptional promoter, eg DNA encoding alcohol dehydrogenase
Di Di Disclooure; Fig 8; 79pp; English.
This sequence is used for expressing higher eucaryotic genes in Aspergillus through the use of a recombinant plasmid capable of integration into the chromosome DNA of Aspergillus. See also

Claim 15; Page 35-42; 70pp; English.

The Bacillus subtilis chromosomal DNA region comprises the srfA operon which encodes the multienzyme complex surfactin synthetase (MCSS). Analysis of the sequence showed four regions potentially coding for proteins, a zone upstream of the first ORF contg. the stop codon of the fourth ORF. ORF2 encodes a protein of the stop codon of the furth ORF. ORF2 encodes a protein (shown) which can be divided into 3 adjacent repeat regions with internal homology followed by a region (module B) of 500 amino acids very similar to that of ORF1 and homologous to tyrocidin and gramicidin synthetase subunits I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

PT Transgemic corn plant cells - comprise e.g. coat protein gene of maize dwarf mosaic viral strain, produces plant resistant to provinal challenge are then used to produce plants resistant to viral challenge are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce plants resistant cc corn plant cells. These are then used to produce sund cranscriptional cc corn plants are available and transcriptional cranscriptional factors of viral movement protein genes, viral sequences, viral negenco, origin.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#title Two developmentally controlled promoters of Streptomyces
coelicolor A3(2) that resemble the major class of
motility-related promoters in other bacteria.

Mean 22.211; Variance 20.944; scale 1.060 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

BIOCHEM. BIOPHYS. RES. COMMUN. 159:19-25(1989).

-!- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX (COMPLEX LII OR CYTOCHROME B-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYMPHESIS.

-!- THE RIESKE PROTEIN IS A HIGH POTENTIAL 2FE-2S PROTEIN.
-!- CATALITIC ACTIVITY: QH(2) + 2 FERRICYTOCHROME C = Q +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-FEB-1991 (REL. 17, LAST SEQUENCE UPDATE)

A KUROTSU T., HORI K., KANDA M., SAITO Y.;

L. J. BIOCHEM. 109763-76917691).

- I- FUNCTION: THIS PROTEIN IS A MULTIFUNCTIONAL ENZYME, ABLE TO ACTIVATE AND POLYMERIZE THE AMINO ACIDS PRO, VAL, ORN AND LEU.

C -I- FUNCTION: THIS PROTEIN IS A MULTIFUNCTIONAL DOMAINS.

C -I- PATHWAY: NON-RIBOSOMAL BIOSYNTHESIS OF THE CYCLIC PEPTIDE

ANTIBIOTIC GRAMCIDIN S (D-PHE-PRO-VAL-ORN-LEU)2.

C -I- COPACTOR: CONTAINS FOUR COVALENTY BOUND PHOSPHOPANTETHEINES.

C -I- COPACTOR: CONTAINS FOUR COVALENTE. BOUND PHOSPHOPANTETHEINES.

C -I- SUMILARITY: TO OTHER ENZYMES WHICH ACT VIA AN ATP-DEPENDENT

C COVALENT BINDING OF AMP TO THEIR SUBSTRATE.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 6; Page 73; 148pp; English.
A melanoma-specific immunogen homologous with pMel-17 comprises one
or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-
R82194 capable of eliciting a CTL response. The epitopes R82098-
R82108 are of particular interest. The immunogen can be used for
partial protection in mammals against melanoma peptides which are
homologous with pMel-17 are highly potent stimulators of Hib-A2+
CTLs in several cell lines and can be used in immunotherapy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      detection of tumours (214, 40pp; English.
Claim 1; Page 22-24, 40pp; English.
Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when readiolabelled, they may be used to identify tumour deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

gpl00 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen cDNA25 (see R84854). gpl00 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against cDNA2 and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       08-MAY-1996 (revised)

R84837-853 are G9-280 peptides modified to improve immunogenicity.

R84837-853 are G9-280 peptides modified to improve immunogenicity.

G92280 is an immunogenic peptide based on the melanoma derived antigen, gp100 (see R84206). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                   Claim 81, Fig 5A, 184pp. English.

CDNA2 is a melanoma antigen (MART-1) which is recognized by
T-lymphocytes, and is a derivative of the melanocyte-melanoma-
pecific antigen gpi00 (see R84855). Antigen cDNA25 is a source
of immunogenic peptides (see R84189) which are optionally modified
(see R84200-R84211) to enhance their binding to a MHC molecule and
used in medicaments, especially vaccines, for the treatment or
prevention (by immunisation) of melanoma. Antibodies against cDNA2
and its immunogenic peptides may be used in the detection and
isolation of the antigen from a sample, the detection of which is
indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

WPI: 95-382963/49.

WPI: 95-382963/49.

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5: Page 108: 184pp; English.

R84837-853 are G9-280 peptides medified to improve immunogenicity.

G9-280 is an immunogenic peptide based on the melanoma derived antigen, gpl00 (see R84206). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

A melanoma sepecific immunogen homologous with pWel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-R82194 capable of eliciting a CTL response. The epitopes R82098-R82198 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLs in several cell lines and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

R84837-853 are G9-280 peptides modified to improve immunogenicity.

R84837-853 are G9-280 peptides modified to improve immunogenicity.

G92-280 is an immunogenic peptide based on the melanoma derived antigen, gpl00 (see R84206). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies and against MART-1 and its immunogenic peptides may be used in the detection and isolation of MARR-1 from a sample, the detection of which is sequence 9 AA;

Melanoma-specific immunogen comprises epitope(s) homologous with powel. T - are highly potent stimulators of HLA-A2+CTL's useful in adoptive immuno-therapy
Claim 10; Page 90; 148pp; English.

A melanoma-specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-R82194 capable of eliciting a CTL response. The epitopes R82098-R82108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLs in several cell lines and can be used in immunotherapy or

-1- DISEASE: BORDETELLA PERTUSSIS IS THE CAUSATIVE AGENT OF WHOOPING COUGH. AN ESSENTIAL STEP IN THE DISEASE PROCESS IS THE ATTACHMENT OF THE CILLATED EPITHELIUM OF THE RESPIRATORY TRACT, ENABLING THE ORGANISM TO RESIST NORMAL HOST-CLEARANCE MECHANISMS. IT IS UNCLEAR WHICH BACTERIAL CELL SURFACE COMPONENT ARE RESPONSIBLE FOR ADHERENCE BUT THE FINBRIAGE OF B.PERTUSSIS ARE PRIME CANDIDATES FOR BEING INVOLVED IN THIS PROCESS.

-: SUBCELLULAR LOCATION: PILI STRUCTURE ON THE CELL SURFACE.

-: SUMILARITY: BELONGS TO THE FINA/PARA FAMILY OF FIMBRIA PROTEINS.
                                                                                                                                                                                                                                           Gaps

1- DISEASE: BORDETELLA PERTUSSIS IS THE CAUSATIVE AGENT OF WHOOPING COUGH. AN ESSENTIAL STEP IN THE DISEASE PROCESS IS THE ATTACHMENT OF THE LILATED EPITHELLUM OF THE RESPIRATORY THE ORGANISM TO RESIST NORMAL HOST-CLEARANCE MECHANISMS. IT IS UNCLEAR WHICH BACTERIAL CELL SURFACE COMPONENT ARE RESPONSIBLE FOR ADHERENCE BUT THE FINBRIAR OF B. PERTUSSIS ARE PRIME CANDIDATES FOR BEING INVOLVED IN THIS PROCESS.

1- SUBJECTIOUR LOCATION: PILL STRUCTURE ON THE CELL SURFACE.

1- SIMILARITY: BELONGS TO THE FIMA/PAPA FAMILY OF FIMBRIA PROTEINS.

-!- SUBUNIT: CONSISTS OF TWO SUBUNITS (258 KD AND 55 KD).
-!- DOMAIN: THE DNA POLYMERASE ACTIVITY DOMAIN RESIDES IN THE
N-TERMINAL HALF OF THE PROTEIN, WHILE THE C-TERMINUS IS NECESSARY
FOR COMPLEXING SUBUNITS B AND C. THE C-TERMINUS MAY ALSO REGULATE
THE CATALYTIC ACTIVITIES OF THE ENZYME.
-!- IN EUKARYOTES THERE ARE FIVE DNA POLYMERASES: ALPHA, BETA, GAMMA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DELTA, AND EPSILON WHICH ARE RESPONSIBLE FOR DIFFERENT REACTIONS OF DNA SYNTHESIS.

BIOCHEM. BIOPHYS. RES. COMMUN. 161:931-938(1989).

1. FUNCTION: MEDIATES CELL SURFACE INTERACTIONS DURING NERVOUS SYSTEM DEVELOPMENT.

2. SYSTEM DEVELOPMENT.

2. STRICELLULAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHOR.

2. SIMILARITY: BELONGS TO THE IMMUNOCLOBULIN SUPERFAMILY. CONTAINS SIX C2-LIKE DOMAINS FOLLOWED BY FOUR FIBRONECTIN TYPE III-LIKE DOMAINS.

3. SIX C2-LIKE DOMAINS FOLLOWED BY FOUR FIBRONECTIN TYPE III-LIKE DOMAINS.

3. SEPURING STRICE OF A FRAMESHIFT.

3. CAUTION: REF. 2 SEQUENCE DIFFERS FROM THAT SHOWN IN THE C-TERMINUS MD IS LONGER DUE TO A FRAMESHIFT.

-1-FUNCTION: MAJOR ROLE IN THE SYNTHESIS OF NUCLEOSIDE TRIPHOSPHATES OTHER THAN ATP.

-1-FUNCTION: ACTS AS A TRANSCRIPTIONAL ACTIVATOR OF THE C-MYC GENE; BINDS DNA NONSPECIFICALLY (ACCORDING TO REF. 3).

-1-CATALYTIC ACTIVITY: ATP + NUCLEOSIDE = ADP + NUCLEOSIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AB5, B6).

-1- DISEASE: THIS PROTEIN IS FOUND IN REDUCED AMOUNT IN TUMOUR CELLS.
OF HIGH METAGATASIC POTENTIAL.
-1- SUBCELLULAR ACCATION: NUCLEAR AND CYTOPLASMIC.
-1- SUBLIARITY: TO OTHER NDK ISOZYMES.

PNA encoding melanoma antigens recognised by T-lymphocytes.- also rectors, host cells and antibodies, used to detect, treat and rimmunise animal against melanoma.

PS Claim S5: Page 131: 184Pp: Engilish.

C The immunogenic peptide is derivative of 9p100 (see R84855). The melanoma antigen derivative of 9p100 (see R84855). The medicaments (vaccines) for the treatment or prevention (by immunization) of melanoma. Antibodies against melanoma specific antigens and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state

(melanoma or metastatic melanoma).
                                                                                                                                      25-APR-1996 (first entry)

immunise animal against melanoma.
Claim 81; Fig 5A; 184pp; English.
T-Jymphocytes, and is a derivative of the melanocyte-melanoma antigen (MART-1) which is recognized by T-Tymphocytes, and is a derivative of the melanocyte-melanoma-specific antigen gp100 (see R84855). Antigen cDNA25 is a source of immunogenic peptides (see R84199) which are optionally modified (see R84200-R84211) to enhance their binding to a MHC molecule and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against cDNA2 and its immunogenic peptides may be used in the detection and isolative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detection of tumours
Claim 1; Page 22-24; 40pp; English.
Immunogenic peptides derived from the melanoma associated antigen
may be used in the production of vaccines. Nucleotide sequences
encoding the immunogenic peptides may be used as primers and probes
in the detection of melanoma cells. Tumour infiltrating lymphocytes
capable of binding to the melanoma associated antigen can be
cultured ex vivo and returned to melanoma particles, and when
readiolabelled, they may be used to identify tumour deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Melanoma associated antigen gp100 - used in vaccines and for the

gp100 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-1ymphocytes, and is a derivative of the melanoma-specific antigen cDNA25 (see R84854). gp100 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, especially vaccines, for the treatment or prevention (by immunogenic peptides may be used in the detection and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Human cytochrome P450 IIC19 exon5/exon7 aberrant splice junction. Aberrant splicing variant; abnormal transcription; exon 6; exon 7; PCR; polymerase chain reaction; amplification; detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    18-JAN-1996 (first entry)
Aspergillus terreus triol polyketide synthase.
Triol polyketide synthase; TPKS; HMG-COA reductase inhibitor;
hypercholesterolaemia; LDL- cholesterol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DB 19; Leus.

Novel DNA encoding triol poly-ketide synthase - used to isolate and identify homologues of triol poly-ketide synthase, and in the treatment of typer-cholesterolaemia and in the treatment of Myper-cholesterolaemia and in the treatment of Myper-cholesterolaemia and plantal plantal prysts. 107pp; English.

The full-length TPKS-encoding DNA in plasmid pLOA was designated pryks100. Splicing of the introns from the DNA equence and translation of the 9114 nt ORF results in a protein of 3038 AAS (R74171) with a mol. wt. of 269,090 daltons. Inspection of the TPKS AA sequence for active pite residues and motifs known to be associated with polyketide synthases and fatty acid synthase (RAS) activities resulted in the identification of candidates for expected risks, the succession of activities on the TPKS protein is the same as that observed for the rat FAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Disclosure; Fig.6; 95pp; English.

A probe based on the N'terminal sequence of B. sphaericus P-1 9-13855) surface layer protein was used to screen an HindIII-generated library to isolate the slp gene. Promoter regions of the gene are used in genetic constructs providing surface expression of heterologous proteins in P-1 hosts.
                                                                                                                                                                                                                                                                                                                   Surface layer protein; SLP; fusion protein; vaccine; antigen; surface expression; epitope.

attenuated hepatitis A virus strain.

Claim 1; Fig 1; 18pp; English.

The attenuated HAV is useful for inducing protective immunity against
HAV. This strain (Pass 35) differs from the wild type HAV HAV-175 by
several nucleotide changes distributed throughout the genome, is
attenuated for chimpanzees, elicits serum neutralising antibodies, and is
suitable for use as an HAV vaccine. It is noted that not all the changes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

N6080 and oligonucleotide fragments are useful in detection of hepatitis A virus; transformed hosts may be used for expression of polypeptides and fragments useful in vaccines which are capable of inducing immunocompetent B cells for passive immunotherapy. Pref. epitope is derived from AAs 445-657 or 792-848 of the HAV sequence (P60066).
                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Protein or peptide reactive with Candida albicans induced antibodies
Frotein or peptide reactive with Candida albicans induced antibodies
albicans infections
Claim 7: Page 26; 37pp; English.
Peptides RB1710-25 are derived from the Candida albicans enolase protein
(RB1708). The peptides can be used to diagnose, in a serum sample, antibodies induced by a Candida albicans infection and hence the antibodies induced by a Candida albicans infection and hence the farming candida labicans in large was isolated from a patient with a clinical history of vaginoses. The resultant clone contained a 470 bp open reading frame encoding residues 93-249 (RB1709).
This clone was used to screen a genomic library and obtain the full
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   10-Mar-1996 (first entry)

Page 9-10; 14pp; Japanese.

The present sequence is that of a carbonyl reductase (ALD) isolated from Sporobolomyces salmonicolor IF01038. The enzyme is used in the synthesis of an (R)-gamma-substituted-beta-hydroxybutyrate (GSBH) from a gamma-substituted acetoacetate. The GSBH is useful as a raw material for the synthesis of drugs and agricultural chemicals.

Claim 9; Page 118-126; 159pp; English.
Chicken cytotactin (R94562) and human cytotactin (R94562) are multidomain extracellular matrix proteins capable of simulating neuronal cell attachment, neurite outgrowth and cell elongation. The cytotactins, or functional portions of them (see R94564-69), can be obtd. by expression of encoding DNA (see T14548 and (114547) in host cells, e.g. as GST fusion proteins in Escherichia coll. They have therapeutic and diagnostic applins. and can be used to raise antibodies.

albicans infections
Claim 4; Page 23-24; 37pp; English.
The amino acid sequence of the Candida albicans enolase which has a mol.
The amino acid sequence of the Candida albicans enolase which has a mol.
The amino acid sequence of the Candida albicans enolase which has a mol.
The amino acid sequence of the Candida about the acid from a C.albicans cDNA expression library in lambda-gtil using human sera from a patient with a clinical history of vaginoses. The resultant clone contained a 470 bp open reading frame encoding residues 93-249 (RB1709). This clone was used to screen a genomic library and obtain the full length clone. The protein sequence was used to generate the peptides RB1710-25 which can be used to diagnose, in a serum sample, antibodies induced by a candida albicans infection and hence the infection itself.
                                                                                                                                                                       albicans infections (large of the state) present of diagnose c. Claim 6; Page 23-24; 37pp; English.

The amino acid sequence of residues 93-249 of the 48 kD Candida albicans enolase. This DNA encoding this fragment of the full length enolase was isolated from a Calbicans CDNA expression library in lambda-gtil using human sera from a patient with a clinic history of vagenoses. The resultant clone contained a 470 bp open reading frame encoding residues 93-249. This clone was used to screen a genomic library and obtain the peptides R81710-25 which can be used to diagnose, in a serum sample, antibodies induced by a Candida albicans infection and hence the infection itself.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Mean 20.933; Variance 24.991; scale 0.838 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Agric. Biol. Chem. (1991) 55:1615-1626
Molecular cloning and analysis of nucleotide sequence of the
Bacillus subtilisi lysA gene region using B. subtilis phage
vectors and a multi-copy plasmid, pUB110.
                                                                                                                                                                                                                     ##molecule_type_mRNA

##residues 1-120 ##label ING
NT The sequence is related to the amino end of the myc protein. It is
missing the region thought to be important for nuclear
localization, DNA binding, transforming activity, and
oligomerization.
                               1-178 ##label ASK
the authors translated the codon CAC for residue 173 as
Gln
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Mean 21.779; Variance 20.464; scale 1.064 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
